

The console across a whole call, and every surface behind it.

2c taken all the way, and grounded in the real **ambientqa** code: the keymap (**p a s x d l t**), the two-stage gate with per-channel policy, cue-style answers, the answer audit and the missed-question sweeper, Whisper/Ollama running locally, JSONL session replay. Color: Modernist structure kept exactly — flat, 0 radius, 2px rules, Archivo, flush-left — with the accent swapped to cybic violet **#5b2fe0**; blue **#1479e0** carries the customer channel and inbound events, and red is now reserved for destructive only (End call, Decline). The brand mark is the only gradient in the system.

3a	Standby — no call, nothing asked. Readiness, not decoration: what is warm, what is listening, what happened today.	3b	Incoming — the console stays put behind a single blue-ruled panel. Everything shown is what changes how you open the call.
3c	On a call, nothing asked yet — the answer column stays empty and says so, and shows what the gate just declined and why. The state you spend most of a call in.	3d	Question caught, answer streaming — cue style: one sayable line, then keywords. Caret still running, gate decision and sources shown.
3e	Self-correction — a card the auditor rewrote (revised) and one the sweeper resurrected 25 s late. Both states need to be visibly different from a fresh answer.	3f	Paused — a paused app must never look like a quiet one. Full-width bar, transcript frozen, the whole chrome goes flat.
3g	Settings — a slide-over on the right, never a takeover: the call stays visible and audible while you change anything. Every value here is a real one from config.toml.	3h	Audio devices, selecting one — every row metered at once so you speak once and pick the loudest. This is the modal the D key opens.
3i	Question gate, mid-selection — tight just picked, so the panel explains what changes and what it costs. Per-channel policy is a matrix, not a toggle.	3j	Answers, mid-selection — picking a style rewrites the same real answer in the preview, so the choice is made on the output, not the label.
3k	Knowledge profile, one keypress (X) — list on the left, the selected profile's actual markdown on the right, so you swap queues knowing what changes.	3l	Sessions (L) — the QA and coaching surface. Read-only replay of one call, every decision the gate made and why, from the local JSONL.
